Claims:

1. A display element comprising at least two porous layers, a conductive liquid residing in the upper layer, the liquid having a contact angle with the material of the upper layer of less than about 60°, the material of the lower layer being conductive and insulated from the liquid with a dielectric covering, the liquid having a contact angle with the material of the lower layer of greater than about 90°, whereby on application of a voltage between the lower layer and the liquid the liquid moves out of the upper layer into the lower layer thereby effecting an optical change in the upper layer.

10

5

- 2. An element as claimed in claim 1 wherein the upper layer comprises a plurality of particles.
- 3. An element as claimed in claim 1 or 2 wherein the lower layer comprises a plurality of conductive particles covered with a dielectric layer.
 - 4. An element as claimed in claim 3 wherein the conductive particles are metallic.
- An element as claimed in claim 3 wherein the conductive particles are organic or inorganic particles covered with a conductive shell.
 - 6. An element as claimed in claim 5 wherein the thickness of the conductive shell is chosen to create a coloured particle.

25

- 7. An element as claimed in any preceding claim wherein the dielectric covering is a polymer, a polyelectrolyte, a fluoropolymer, a self assembled monolayer (SAM) or an inorganic shell.
- 30 8. An element as claimed in claim 7 wherein the SAM comprises a molecule with a group that bonds to the conductive particles and a group that provides a high contact angle with the liquid.

- 9. An element as claimed in any preceding claim wherein an intermediate layer of coloured material is provided between the upper layer and the lower layer.
- 5 10. An element as claimed in claim 9 wherein the material of the intermediate layer comprises a plurality of particles providing an average pore size substantially the same as that of the upper layer, the liquid having a contact angle with the plurality of particles of less than about 60°.
- 10 An element as claimed in any preceding claim wherein each layer has a pore size greater than about 30 nm and less than about 2µm.
- 12. An element as claimed in any preceding claim wherein the conductive liquid and the material of the upper layer have substantially the same refractive index.
 - 13. An element as claimed in any preceding claim wherein the conductive liquid is created by adding ions to a solvent.
- 20 14. An element as claimed in any of claims 1 to 12 wherein the conductive liquid is an ionic liquid.
 - 15. An element as claimed in any preceding claim wherein the conductive liquid contains a dye or pigment to provide a coloured liquid.

25

- 16. An element as claimed in any preceding claim wherein the upper layer comprises a photonic crystal structure.
- 17. A device comprising at least one element as claimed in any preceding claim including means for connection of each element to a circuit to create a matrix display.

- 18. A device comprising at least one element as claimed in any preceding claim, the materials of each layer being coated onto a support material.
- 19. A device as claimed in claim 18 wherein each element is5 environmentally sealed.
